

Message

Pharmaceutical sciences are one of the most important sciences to be considered nowadays. The progress in drug design and various formulation structures has caused a revolution in the pharmaceutical market. The thing which implied the indulgence of other sciences within the core of pharmaceutical sciences to enable researchers to reach behind barriers. Nowadays; we can find fields like pharmacovigilance, pharmacoconomics, industrial and clinical pharmacy are crossing their way fast towards another horizon of scientific progress, to present a completion of drug delivery system studies before and after being handed to the patient. Simultaneously; interdisciplinary fields as biomedical sciences, molecular and cellular biology as well as bioengineering and biophysics coupled with artificial intelligence and biotechnology have invaded the world of drug research to present a new revolution in research and industry of personalized medicines, giving hopes to billions of patients worldwide to cure the incurable resistant diseases. Thanks to research, the word could have never been spread that virulent and that fast. And in order to guarantee continuous progress, our role as researchers lies in spreading knowledge in the form of our research findings braised within a context of scientific ethics to help every researcher to cross beyond any barrier that might hinder our role in saving the world through what is presented. So, lets believe in what we present. Lets be honest in the information presented. Let this journal be a minaret for other researchers, to enable them build up on what we present and offer. Lets help scientists expand vertically. Not only horizontally in the field of drug delivery and various domains of pharmaceutical sciences. Lets aims at unveiling all drug mysteries aiming to a better world for all patients worldwide.
